

Managed Security

Protect your mission-critical data, applications and infrastructure with Webair's Managed Security solutions.

Web-based security threats are evolving, not only in frequency but also sophistication. Webair's Managed Security solutions protect the integrity of your business against malicious assaults on critical systems, applications and infrastructure. From Distributed Denial of Service (DDoS) Mitigation, to Managed Firewalls, to 24x7 Monitoring, Webair safeguards your business, helping you avoid downtime and gain peace of mind by offering the most comprehensive physical and virtual asset protection.

Multi-Layer DDoS Mitigation

Your environment is vulnerable to over 7,000 Distributed Denial of Service (DDoS) attacks every single day. Many of them are now multi-vector in nature and can overcome traditional defense mechanisms or reactive countermeasures.

Webair's industry-leading DDoS Mitigation solutions ensure that every aspect of customers' infrastructure is monitored and protected against security threats, ensuring maximum uptime. Offering both Proxy-based and Volumetric DDoS Mitigation services, Webair safeguards customers' businesses from the harmful effects of DDoS threats, including site disruptions and downtime, which can damage reputation and customer trust.

DDoS-Protected IP Transit

Webair's IP Transit solution features built-in DDoS protection to ensure the best network performance. Webair's DDoS-protected IP Transit can be provided via BGP routing or a simple IP gateway, and offers world-class connectivity via multiple Tier-1 providers, as well as direct peering. Customers enjoy reliable, automated attack mitigation without any human intervention, as well as immediate notification of any attack via their preferred method of SMS, email or phone.

Proxy-based DDoS Mitigation

With Webair's Proxy-based DDoS Mitigation, traffic is first directed to a proxy server on the company's DDoS-protected network, eliminating the threat of attacks and only forwarding clean traffic to customer servers. Customers can enable DDoS mitigation capabilities on-demand to protect their servers and VM instances from even the largest DDoS attacks.

Volumetric DDoS Mitigation

Volume-based DDoS attacks are the most common, aiming to saturate the bandwidth resources, networking equipment or servers of the target network or service. Webair's DDoS Mitigation, unlike traditional hardware or bandwidth solutions, prevents volumetric attacks by filtering harmful traffic in the cloud before it reaches customers' network. Customers also benefit from centralized monitoring, DDoS-specific alerting, logging and reporting systems, as well as access to experienced DDoS mitigation professionals.

Managed Security

Managed Firewalls

Webair's Managed Firewalls offer an added layer of protection for your entire environment, managed and monitored 24x7x365 by our dedicated security experts. Webair ensures your firewalls are properly deployed, maintained and patched to remain up-to-date with the latest security threats.

Managed Dedicated Firewall

No shared services mean no security threats. Dedicated solely to you, Webair's Dedicated Firewalls protect your servers, VM instances and applications as well as entire Private and Hybrid Cloud environments from DDoS attacks, SQL injections, and brute-force password cracking. Delivered with our easy-to-use administration console, EZPanel, Webair's Managed Dedicated Firewalls are easily configurable and scalable to meet specific traffic and business security needs. Benefit from 24x7 monitoring and management of your entire security environment as well as the ability to tie site-to-site Virtual Private Networks (VPNs). Webair's Web Application Firewalls (WAFs) also monitor traffic across various web service layers including HTTP, HTTPS, identifying and mitigating any security threats before they reach your servers.

Managed Cloud Firewall

Ironclad security, delivered instantly to your door. Get the all of the benefits of a fully Managed Dedicated Firewall with the added features of true scalability, near-instant delivery and easy integration. Webair's Managed Cloud Firewall protects your business against brute force, DDoS, SQL injection, and various other types of cyber attacks. They also offer high availability and can be deployed from any one of our state-of-the-art, redundant data center locations around the world. Backed by 24x7 monitoring and management of your entire security environment as well as the ability to tie site-to-site Virtual Private Networks (VPNs), Webair's Managed Cloud Firewall enables real-time response and remediation of security threats before they can impact your network. Complete with WAF capabilities, our comprehensive solution prevents common web threats and specialized attacks at the application level, protecting the systems and applications your business and customers rely on.

24x7x365 Monitoring

Combined, Webair's monitoring platform and security support experts ensure every single layer of customers' infrastructure – from servers, networks, applications and services – is safe and monitored 24x7x365. Webair's customer-specific, customized server alerts also enable the localization and troubleshooting of any issue before it affects performance.
